
9th July 2026

Dear Hiring Manager,

I am a Staff Software Engineer and distributed systems architect with over 15 years of experience building fault-tolerant, internet-scale backend platforms. I bring a language-agnostic approach to engineering, a passion for feature velocity, and deep operational expertise in scaling user-facing growth services.

Reddit's mission to optimize its Onboarding experience, scale its ML-powered personalization pipelines, and leverage rigorous product experimentation aligns perfectly with my background. Throughout my career, I have specialized in building backend systems that drive user retention, managing complex data signals, and balancing rapid feature iteration with platform reliability:

- **BILL / Growth & Velocity:** Led the multi-year architectural roadmap to decompose a 15-year-old monolith into microservices. Implemented an **Eligibility Checker** that streamlined high-throughput data streams, drastically accelerating deployment velocity and time-to-market for new user features..
- **Capital One / Cross-Functional Execution:** Directed technical strategy across multiple distributed vendor teams to migrate core infrastructure in-house. Partnered closely with product, legal, and finance stakeholders to smoothly launch business-critical systems..
- **Cengage & Domino's / Personalization & Funnels:** I have a proven track record of optimizing user funnels and content delivery at scale, including architecting a subscription platform ('the Netflix of publishing') supporting 1.5M+ users with personalized content streams, and performance-tuning infrastructure to sustain millions of concurrent global requests.

Beyond my corporate experience, I am the primary committer on **Experiment4J** (a Java implementation after GitHub's Scientist pattern). This project reflects my deep fluency in **production experimentation infrastructure**, specializing in designing safe parallel execution paths to run live A/B tests on critical paths with zero user-facing degradation.

I am an undying advocate for data-informed growth, highly comfortable navigating **growth-team ambiguity in Go or Python**, and passionate about partnering with ML and data science teams to scale backend inference pipelines. I would love to discuss how my distributed systems and experimentation expertise can help turn new users into lifelong Redditors.

Sincerely,

Judes Tumuhairwe
